# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (‡).

### MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

### HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

### EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

## COMMENT ON CURRENT TRENDS

### CURRENT MOREBIDITY IN THE CONTINENTAL UNITED STATES

#### All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes and from all diseases combined both decreased slightly for the third consecutive week, reflecting chiefly corresponding declines in morbidity from colds, influenza, etc. The general trend of morbidity from all causes and from disease has thus far in 1944 been steadily downward, with admission rates well below those for the corresponding period in 1943, when they remained practically level until the latter part of March. For the week ending 10 March 1944 the admission rate from all causes was reported at 717 per year per thousand, while the admission rate from disease was reported at 650 per year, both being about 28 percent below the corresponding rates for the week ending 12 March 1943. The admission rate from injury continued on the low level which has prevailed in recent months.

#### Respiratory Causes:

The admission rate from colds, influenza, etc. continued downward and for the week ending 10 March 1944 was reported at 231 per year per thousand, or about 4 percent lower than for the preceding week. Since about the middle of January 1944, morbidity from colds, influenza, etc. has been about 35 percent below that recorded for the corresponding period of 1943. The admission rate from all forms of pneumonia declined to 16 per thousand, which is about 10 percent under the preceding week's rate and about 35 percent under the rate for the corresponding week of 1943.

#### Common Communicable Diseases:

New cases of measles registered a sharp drop, but new cases of mumps increased to the highest weekly total reported in 1944 and new cases of scarlet fever rose practically to the record figure reported for the week ending 25 February 1944. The number of new cases of meningitis and rheumatic fever remained substantially the same as for the preceding week.

### VARIATIONS IN MOREBIDITY BY SERVICE COMMAND:

#### All Causes: Disease and Injury:

Substantial declines in morbidity from all causes and from disease were registered in the First and Sixth Service Commands. The other Service Commands reported relatively insignificant changes in morbidity. In the First Service Command the decrease in the admission rates reflected chiefly the subsidence of an outbreak of food-poisoning at Bradley Field, Conn., which had been responsible for the sharp increase in morbidity in the First Service Command during the week ending 3 March 1944. The decline in the admission rate for the Sixth Service Command was in part attributable to lower morbidity from colds, influenza, etc. and also to sharply lower injury admissions. Nevertheless, the Sixth Service Command continued to report the highest admission rate from all causes (967 per thousand). The Eighth Service Command continued to have the lowest morbidity, 632 per 1000

# WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 10 MARCH 1944

## COMMENT ON CURRENT TRENDS (CONT'D)

### Respiratory Causes:

The largest decrease in the admission rate from colds, influenza, etc. (about 9 percent) was reported by the Sixth Service Command. The First, Third, and Fifth Service Commands also showed significantly lower morbidity from colds, influenza, etc. Only the Military District of Washington and the Second Service Command reported slightly higher admission rates from these causes. The Seventh Service Command continued to experience the highest morbidity from colds, influenza, etc. (415 per thousand), while the lowest admission rate from these causes (166 per thousand) was again reported by the Eighth Service Command. The Third Service Command and the Military District of Washington reported substantial declines in morbidity from pneumonia.

### Common Communicable Diseases:

A sharp rise in morbidity from venereal disease (excluding EPTI cases) was recorded for the Sixth Service Command, which as a result showed the highest morbidity from these causes (40 per thousand) for the week ending 10 March 1944. New cases of measles showed substantial decreases in the Fourth, Eighth, and Third Service Commands. The increase in the number of new cases of mumps was distributed fairly uniformly throughout the country; however more than a third of the new cases occurred in the Fourth Service Command. The Seventh and Ninth Service Commands each reported 100 or more new cases of scarlet fever, but the largest increases in new cases were recorded in the Ninth and Fourth Service Commands.

### STATIONS WITH HIGHEST MORBIDITY RATES:

Greensboro ETC, N. C. continued to report by far, the highest admission rates from all causes, from disease, and from colds, influenza, etc. because of their policy of hospitalizing minor respiratory ailments as a preventative measure. Among the other stations with high admission rates from all causes were two reception centers (Ft. Sheridan, Ill. and Camp Upton, N.Y.) which had high morbidity due to venereal EPTI cases and one station (Camp Abbot, Ore.) with high morbidity from colds, influenza, etc. The Tennessee Maneuver Area continued to report high morbidity from injury and Sioux Falls, S.D. again reported a very high admission rate from pneumonia.

### CURRENT HOSPITAL CONDITIONS:

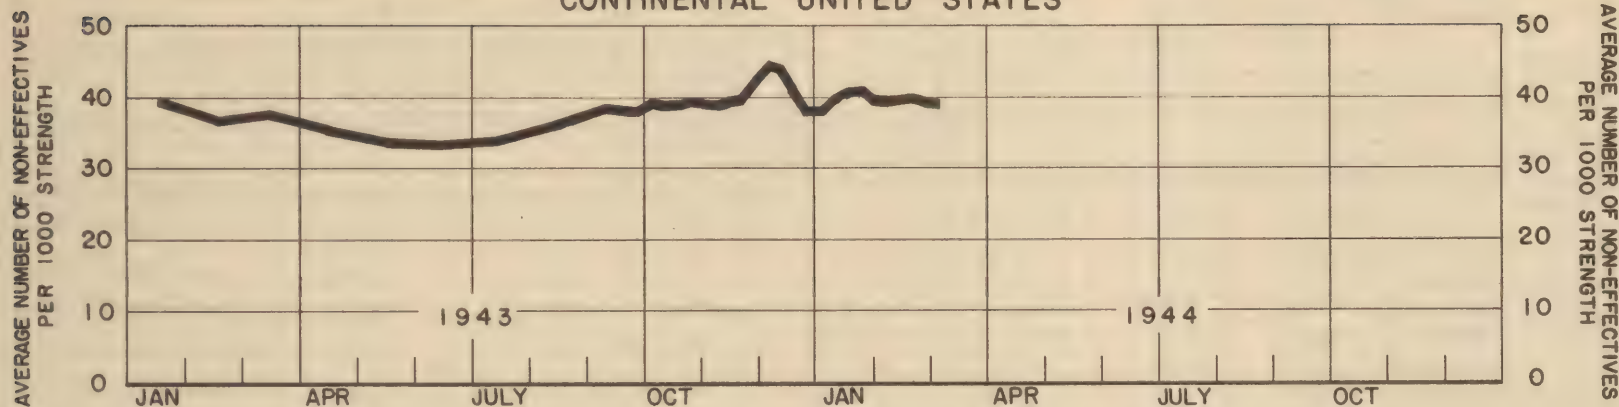

The total bed capacity as of 10 March 1944 was reported at 382,000 or 2,000 less than at the end of the previous week. The number of beds occupied was just over 164,000 or 4,000 less than at the end of the previous week, while the number of "available vacant" beds increased to 142,000. There were 14 stations with bed capacity of about 4,500 having no "available vacant" beds; no General Hospital was included among these stations. On 10 March 1944 there were 2071 cases of malaria remaining under treatment, all but 15 of which had presumably been acquired outside the U.S. The number of neuropsychiatric cases remaining at end of week was reported at 16,947 while the number of tuberculosis cases remaining totaled 1132.

# SUPPLEMENTARY HEALTH REPORT

FOR WEEK ENDING 25 FEBRUARY 1944

## COMMENT ON ADMISSION RATES TO HOSPITAL AND TO QUARTERS

For the week ending 25 February 1944, a special study was made to develop admission rates from disease and from injury, separately for cases which involved hospitalization and for those which involved confinement to quarters only. Accordingly the data have been tabulated so as to include with admissions to hospital all cases originally admitted to quarters and then transferred to hospital. This procedure gives a reasonably accurate picture of the aggregate admission rate to hospital and the net admission rate to quarters for cases confined to quarters only.

For the continental United States as a whole the admission rate from all causes of 772 per thousand strength was found to be composed of a rate of 694 per thousand for hospital admissions and a rate of 78 per thousand strength for quarters admissions, as defined above. Thus only 10 percent of the total admissions were cases involving confinement in quarters exclusively. This same proportion held for both disease admissions and injury admissions.

As compared with the week ending 28 January 1944, when admissions involving confinement to quarters only made up 13 percent of the total admissions, the corresponding figure for the current week is lower for several reasons. First, several large stations which had been reporting certain hospital cases incorrectly as quarters cases submitted correct reports for the current week. Second, the admission rate for respiratory diseases was lower in February than in January, and this cause constitutes a sizeable proportion of quarters cases.

The relative proportion of the total admissions which involved confinement to quarters only varied from a high of 20 percent in the First Service Command and the Military District of Washington to a low of 8 percent in the Sixth, Eighth and Ninth Service Commands. The Third Service Command showed 16 percent of the total admissions as quarters cases exclusively. The other Service Commands all reported such admissions in the neighborhood of 10 percent of the total.

Under normal conditions large stations tend to have relatively few quarters admissions, such treatment being reserved largely for cases involving definitely minor ailments. When hospital facilities are over-loaded, as in times of high morbidity from common respiratory diseases, a considerable proportion of the respiratory cases might be given treatment in quarters. Certain types of units, chiefly general dispensaries in the large cities and college training units, report a sizeable proportion of patients as confined to quarters, because they are frequently not located near a station hospital and therefore tend to treat their patients in quarters or dispensaries.

The following stations, all with strength of 5000 or over, had quarters admission rates from all causes combined in excess of 600 per thousand: Greensboro, N.C. ETC, Ft. Des Moines, Iowa, Ft. Eustis, Va. and Ft. Oglethorpe, Ga. The very high admission rate for Greensboro, N.C. reflects that camp's policy of treating a substantial proportion of common respiratory cases by short confinement to quarters, as a preventative measure. It is noteworthy that both Ft. Oglethorpe and Ft. Des Moines are predominantly composed of WAC personnel.

For units with strength of under 5000, admissions involving confinement to quarters exclusively accounted for 20 percent of the total admissions reported by such units, in contrast with a corresponding figure of only 7 percent for larger units. The First Service Command reported a relatively high proportion of quarters cases because about 1/3 of its strength was in small units which had a relatively high proportion of quarters cases (about 35%).
